

# Existential Loop

 = Dis-synchronicity between human's and nature's time

 deforestation data

An AI is trained to search on the Internet for data related to what was needed to build the original machine hacked for the artwork. Deforestation, mining and subemployment are considered in this process. Another AI is trained to calculate the time necessary for nature to recover from the extractions needed to build the original dehumidifier (This algorithm is based on time forecasting.)

A dehumidifier collects moisture from the atmosphere in the exhibition space, feeding the system with water.

The water drips into a Plexi receptacle, which accumulates water.

water cycle 

The custom dehumidifier contains tubing and conduits that feed a nozzle.

A single tear is released when there is dis-synchronicity between the extractions from Amazon forest and the time that the forest requires for recovery and renewal.

The tear falls into a glowing basin, lit from beneath by a screen that spells out the A.I's ecological forecast.
