

# Existential Loop:

Does A.I. shed mechanical tears when trees are cut down to power machines?

Cesar & Lois

In the installation, a dehumidifier collects moisture from the atmosphere in the exhibition space. This feeds the system with water culled from the atmosphere. An artificial intelligence trained on nature's growth releases one reclaimed water droplet for each acreage of forest that is lost.

The A.I. searches for and assesses ecological forecasts on the Internet, and if the prognosis is favorable, sends a signal to release moisture back into the environment.
